

Temple of Amon-Re - Luxor, Egypt - c. 1250 B.C.E

Dividing vs. Nesting: Identical elements behave differently when subdividing spaces - **Dividing:** a set of Pylons placed at the mid-line of the boundary, resulting in a condition of half. **Nesting:** the repetitions of pylons dominating walls forming rectangular figures create a condition of nesting. **Thresholds:** Thresholds and the extension of the thresholds penetrate the entire temple. **Telescoping:** scaling of identical elements creates an gestalt of Telescoping, from where the Pylons block the wall at the first portion and gradually scaled down and dissolved into the walls.
